2. 2. Proposal Draft (pricing open)
3. 3. Pipeline Card

1. Build Prompt · Portfolio Demonstration

Saved 2026-09-30. Paste everything between the lines into a NEW Claude Code project. Strongly recommended: attach

`Investment_Map_DEMO_WHITELABEL.html` from this repo to that conversation as the reference implementation.

You are building a high-level working demonstration called **The Investment Map · Portfolio Demonstration**. It extends a proven corridor decision tool into site-level and deal-structure analysis. I am validating feasibility for a client proposal, so this is an internal demonstration with stylized data, not a client deliverable. I am a visual person: I need to click through every feature, not read about it.

If I have attached a file named `Investment_Map_DEMO_WHITELABEL.html`, read it first and reuse its engine patterns (state model, pillar objects, metric factors, scenario snapshots, render-everything-on-change, localStorage persistence, print export). If it is not attached, build from this spec alone.

What it is

One self-contained HTML file. No backend, no build step, vanilla JavaScript. A landing view opens on three workspaces. Each workspace is one live deal type. One shared decision engine powers all three.

Landing view. Title: "The Investment Map". Tag: "Portfolio Demonstration". One line: "One decision engine. Three live deal types. Demonstration data." Three cards, one per workspace, each with a one-line description and an Open button.

Workspace 1: The District (a small Southern city)

A district revitalization study. About 40 stylized parcels drawn as a schematic street grid or corridor band (no real addresses, label parcels D-01, D-02, ...). Each parcel carries: land sqft, existing building sqft or none, year built or none, assessed value or exempt, existing use.

- Assign editable investment pillars parcel by parcel (defaults: Housing, Commercial, Community and Education, Green and Public Realm; each has a color, an icon, cost per sqft by construction mode, and outcome metrics).

- Live totals: parcels assigned, estimated investment, outcomes, value created, new annual property tax.
- **Capital stack panel** (the new piece): per scenario, editable source lines: Public partner resources, Grants, Debt, Partner equity, HCDC equity. The panel always shows THE GAP: total cost minus committed sources, big and unmissable.
- **Role toggle: Advisor vs Equity Partner.** Advisor shows an advisory fee line and zero balance sheet exposure. Equity Partner moves HCDC equity into the stack and shows ownership share of projected value created. The toggle answers: what does it take for the gap to close, and what role does that imply?

Workspace 2: The Five-Acre Site (single parcel)

One parcel, 217,800 sqft, with a small existing building. The scenario axis here is DEAL STRUCTURE, not land use. Eight structure cards, each selectable as the active scenario:

1. Buy outright (cash or debt)
2. Option contract with entitlement period
3. Ground lease
4. Fee developer
5. Joint venture, owner contributes land as equity
6. Phased takedown
7. Seller financing
8. Public conveyance or authority partnership

Each structure computes and displays: capital required day one, total capital at completion, HCDC role, control timeline, risk level (Low, Medium, High with color), income type (fee, equity return, both), and the capital stack under that structure. A Compare view puts all eight in one table so the tradeoff is visible at a glance. All assumption numbers are editable.

Workspace 3: The Twenty Acres (bank-owned site, large metro)

One 871,200 sqft site owned by a bank. Two decisions on screen:

- **Subdivision concepts.** At least three preset concepts the user can switch between, drawn as a simple diagrammatic site plan (SVG or divs, no mapping library needed): (a) One parcel, single use. (b) Four to six lots, mixed use, user assigns a pillar per lot. (c) Three-phase takedown with phases shaded. Switching concepts recomputes everything. Compare table across concepts: investment, outcomes, value created, new annual tax.
- **Acquisition scenarios.** Price basis selector: market price, distressed or REO price, seller financing terms. The selection flows into every concept's numbers.

This workspace answers: should we buy it, what is highest and best use, and should it stay one parcel or subdivide.

Shared engine (all three workspaces)

- **Construction modes per parcel or lot:** Rehab (cost basis = existing building sqft), New Construction (cost basis = proposed building sqft, an editable input), Demolition plus New (adds a demolition cost per sqft line). Historic Preservation is a rehab variant that adds a historic tax credit line to the capital stack (placeholder 20 percent federal plus a state credit line, both editable).
- **Sustainability toggle per scenario:** adds an editable cost premium percentage, adds green outcome metrics (annual energy savings dollars, green building sqft), and adds unlockable funding lines to the stack (PACE financing, energy credits). Clearly labeled as planning assumptions.
- **Market profiles:** named assumption sets, switchable per workspace: "Small Southern City" and "Large Metro". Each profile sets a construction cost multiplier, a value factor, and an effective property tax rate. A visible chip always shows which profile is

active. All values editable.

- **Projection math** (label everything as planning estimates, editable assumptions, never an appraisal or tax determination):
- $\text{cost} = \text{basis sqft} \times \text{cost per sqft} \times \text{mode adjustment} \times \text{market multiplier}$
- $\text{count outcomes} = \text{floor}(\text{basis sqft} / \text{sqft-per-unit factor})$; $\text{dollar outcomes} = \text{basis sqft} \times \text{dollars-per-sqft factor}$
- $\text{value after investment} = \text{total investment} \times \text{value factor}$
- $\text{value created} = \text{value after investment} - \text{current assessed value}$
- $\text{new annual property tax} = \text{value after investment} \times \text{effective tax rate}$
- **Scenarios:** save the current state of any workspace under a name, list saved scenarios with a small visual strip, load any scenario, and compare scenarios side by side in a table.
- **Partner Brief export:** a print-ready one-page brief for the active scenario: recommendation line, the key numbers, the capital stack, and the diagram. Framing: the client team keeps the instrument, partners receive the paper. Use the browser print dialog, no libraries required.
- **Edit Pillars view:** add, rename, recolor, reprice pillars and their outcome metrics at any time.
- **Persistence:** everything saves to localStorage and restores on reload.
- **Guided tour:** a short click-through tour, one step per major feature, that starts on first visit and can be reopened from a help button.

Design system (non-negotiable)

Background cream #FCFAF1. Text ink #101C28. Accent colors in this fixed order: Brick #D95448, Gold #F1BA4B, Grove #47AB4F, Turquoise #00BCC5. Turquoise is the only action and link color. A four-dot mark (one dot of each color, in order) sits beside the wordmark. One thin spectrum rule runs Brick to Turquoise through Gold and Grove, never reversed. Headings in Fraunces (Google Fonts, graceful fallback to Georgia). Body in Inter (fallback to system sans). No em dashes anywhere in interface text. Footer: "Connecting Dots and Strategies · Reclaiming the map. · Demonstration data."

Language rules

Never use the words software, platform, product, AI-powered, or patent pending. Say: instrument, decision environment, analysis, demonstration. Every read-only figure of record gets a small "reference" badge. Every projection carries "planning estimate, editable assumptions" language.

Technical rules

Single HTML file. Chart.js from a CDN is allowed for dashboard charts but the page must degrade gracefully without it (tables instead of charts). No mapping library: the district and site plans are schematic (divs or inline SVG). Works when opened from a local file with no internet except fonts and charts. Keep it under 400 KB.

Acceptance checklist (verify each before you finish, then show me)

1. Landing view shows three workspace cards and the exact title and line.
2. District: assign 5 parcels across 2 pillars, totals update live, the gap in the capital stack changes when a source line is edited.
3. District: Advisor vs Equity Partner toggle visibly changes the stack and the role summary.
4. Five-acre: all 8 structures selectable, each changes capital required, risk, and income type; the compare table shows all 8.
5. Twenty acres: switching the 3 subdivision concepts redraws the site plan and recomputes; assigning pillars per lot works in the mixed concept; REO vs market price basis changes the numbers.
6. Rehab vs New Construction vs Demo plus New produce different costs on the same parcel; Historic variant shows credit lines in the stack.

7. Sustainability toggle adds premium, green metrics, and funding lines.
8. Market profile switch changes costs, value, and tax figures visibly.
9. Save two scenarios, reload the page, both restore; compare table works.
10. Partner Brief prints one clean page for the active scenario.
11. Edit Pillars changes propagate to totals immediately.
12. The banned words appear nowhere; the brand system is applied throughout.

Work through the build, then walk me through the acceptance checklist with screenshots so I can see every feature working.

Note to self (not part of the prompt)

This demonstration stays internal until the provisional patent application is filed. Do not host it or send it to HCDC or anyone else before filing or before an engagement agreement with confidentiality language is signed. The new mechanisms in it (deal structure scenarios, subdivision concepts, market profiles, capital stack with role toggle) are claimable embodiments already described in ip-disclosure/TECHNICAL-DISCLOSURE.md section 12.

2. Proposal Draft (pricing open)

DRAFT for Christa's review. Nothing sent. Pricing is placeholder, her call. Voice check: warm, direct, short sentences, no em dashes, one clear next step.

Sheneh,

Thank you for the conversation. What you described is exactly what the Investment Map was built to do: put a live decision environment under the deals you are already in, so your team can test the options before the capital moves.

You named three live decisions. Here is how I would put the instrument under each one.

1. The Alabama district

We load the district parcels into their own decision environment, built on the records of record: boundaries, ownership, land area, existing use, assessed value. Your team assigns investment pillars parcel by parcel and sees cost, outcomes, value created, and new tax base for each scenario, side by side. Because your partner brings alignment rather than capital, each scenario also carries a capital stack view: what the plan costs, what the partner's public resources can realistically cover, and what gap remains. That gap is the number that answers your real question, whether HCDC enters as advisor or as equity partner, and at what level.

2. The Alabama five-acre site

One site, one decision, several ways in. We model the same site under each structure your team is weighing, plus the ones I would add to the menu:

- Buy outright, cash or debt
- Option contract with an entitlement period, control before ownership
- Ground lease, the land stays with the owner
- Fee developer, fee income with no balance sheet risk
- Joint venture where the owner contributes the land as equity
- Phased takedown, buy in tranches as phases start
- Seller financing or installment terms
- Public conveyance or authority partnership if the city is at the table

Each structure becomes a scenario on the same parcel: same site, different role, different capital, different risk, different return. Your team compares them on one screen and documents the choice.

3. The Atlanta and Decatur twenty acres

This is the strongest fit of the three. We treat the site as its own corridor: we draw candidate subdivision plans as parcels inside the twenty acres, then test them against each other. One parcel, one use. Subdivided, mixed use. Phased. Each concept shows total investment, outcomes, projected value, and new annual tax base, so highest and best use stops being an opinion and becomes a comparison. Because the seller is a bank, the acquisition scenarios can carry distressed pricing and seller-financing assumptions alongside market ones.

The four capabilities you asked about

All four are extensions of the working engine, not new inventions.

1. **Construction modes.** Every parcel carries a mode: rehab, new construction, or demolition plus new. Rehab prices on the existing building square footage of record. New construction prices on proposed square footage. Historic preservation runs as a rehab variant that carries the federal and state historic credit lines in the capital stack.
2. **Sustainability option.** A toggle per scenario: a cost premium assumption, sustainability outcome metrics on the pillars, and the funding sources a green scope unlocks in the stack.
3. **Market calibration.** Alabama and Atlanta each get their own named cost profile: construction costs, value factors, and effective tax rates set to that market. Every assumption stays visible and editable, so your team can tune them as real bids come in.
4. **Partner exports.** Your team keeps the instrument. Partners get the paper: a branded brief per scenario with the recommendation, the numbers, and the corridor picture. No partner logins, no tool access, nothing to train.

Pillars remain fully editable throughout. Your team adds, renames, and reprices them as each deal requires.

Engagement shape

Phase 1. Discovery and data. One working session per site with your team. I assemble the parcel records and boundaries for all three sites and stand up the three decision environments. [X weeks]

Phase 2. Build. The site-level extensions above, applied across all three environments: structure scenarios, construction modes, market profiles, partner brief export. [X weeks]

Phase 3. Decision workshops. One working session per site where your team runs the scenarios live, documents the direction, and leaves with the partner briefs in hand. [X weeks]

Investment. [Phase pricing placeholder. Recommended architecture: base build covering the first site at full value, per-site activation for sites two and three, and an optional monthly internal-use arrangement that keeps the environments current as HCDC's pipeline grows. Money is Christa's call.]

The tool your team uses stays current as the deals move. The analysis is yours. The data is yours. The instrument remains Connecting Dots and Strategies work product, licensed for HCDC's internal use.

The next step is a thirty-minute call to confirm which site goes first and who needs to sign. I will bring the agreement so a yes can move to paper the same week.

Warm regards,

Christa D. Stoneham Connecting Dots and Strategies

Internal notes (not client-facing)

- Deliver within 24 hours of the 2026-09-30 call per the standard. Follow up day 3 and day 10. Close file day 21.
- Before building anything new for HCDC: file the provisional. The new mechanisms (deal-structure scenarios, subdivision modeling, market profiles, sustainability toggle) are claimable embodiments; most are already described in ip-disclosure/TECHNICAL-DISCLOSURE.md section 12, which is exactly where they should stay until filed.
- Agreement must carry: confidentiality both ways, CDS retains all tool and method IP, client licensed for internal use, client owns their data and the exported briefs, no sublicensing or partner access to the instrument.

- Georgia and Alabama both have state historic tax credit programs and PACE enabling law; verify current program status per site during Phase 1, not in the proposal.

3. Pipeline Card

- **Prospect:** HCDC, Atlanta, GA
- **Decision maker:** Sheneh Joseph (role/title to confirm; signing authority to confirm)
- **Tier:** Project (upgrade path to Partnership if the internal-use arrangement lands)
- **Stage:** Secure — discovery call held 2026-09-30; proposal in drafting
- **Source:** Direct conversation with Christa
- **Next touchpoint:** Proposal delivery within 24 hours of the call (standard). Then day 3 and day 10 follow-ups; close file day 21 if no yes.

Qualification gate (from the 2026-09-30 call)

- Budget range: NOT YET CONFIRMED — surface in proposal call
- Signer in the room: TO CONFIRM — is Sheneh the signature, or does this go to a board/principal?
- Scope nameable: YES — Investment Map as internal analysis instrument across three live deals (see below)
- Red flags: none observed
- Conflict screen: CLEAR — Atlanta GA and Alabama; no business before Houston Land Bank or City of Houston

What they want (their words, from the call)

Internal analysis tool for deals in discussion with their own clientele. Three live use cases:

1. **Alabama district creation.** Partner wants to create/revitalize a district. HCDC deciding between advisory role and equity partner. Partner has no capital but has resources (likely city/public alignment) that could feed the capital stack.
2. **Alabama 5-acre site.** One parcel. Decision: buy outright vs fee developer vs other structures. They asked Christa to bring the fuller menu of structures.
3. **Atlanta/Decatur 20-acre bank-owned site.** Whether to buy, how to attack it, highest and best use, keep as one parcel or subdivide.

Feature asks: new construction vs historic preservation/rehab modes; a sustainability option; regional cost calibration (Alabama rehab prices differently than Atlanta); export recommendations/data to partners WITHOUT giving partners tool access; pillars stay editable/customizable.

The one question the proposal must answer

Is HCDC buying analysis for one decision, or standing decision capacity across their whole pipeline? (One-site project pricing vs multi-site build + internal-use arrangement with per-site activation. The answer sets the price architecture.)

Notes

- All three use cases fit the engine; two require the site-level extensions already on the CDS roadmap (development modes, market cost profiles, deal-structure scenarios, partner brief export). Nothing requires a rearchitecture.
- IP: file the provisional BEFORE building the new mechanisms for HCDC; include confidentiality + CDS-retains-tool-IP language in the agreement (client owns their data and outputs, CDS owns the instrument).

- Proposal draft staged beside this card: `2026-09-30_HCDC-Proposal-Draft.md` . Draft only; nothing sent. Pricing left as placeholders for Christa.

Connecting Dots and Strategies · Reclaiming the map. · Internal draft for Christa's review; pricing and all client-facing language subject to her approval.
